Executive Summary

INSIGHTS

The purpose of this dashboard is to showcase investigations into what could be causing prolonged Emergency Room wait times.

KEY FINDINGS

- With the average ER wait time being *74 minutes* and the median wait time, *67 minutes*, most patients are waiting about an hour to be seen and a small group of patients are waiting a little longer.
- The longest observed wait times occurred on *Monday, Tuesday, Thursday, and Saturday*, and the peak hours that saw the most volume of patients were *00:00 (12:00 AM), 02:00 (2:00 AM), and 21:00 (9:00 PM)*.
- Medium and Low Severity patients accounted for *71% of the visits* during peak periods.
- Admission status had *minimal impact* on wait times.

BUSINESS RECOMMENDATIONS

- Evaluate staffing and patient flow during peak demand periods (days and hours).
- Continue prioritizing Critical and High severity patients through the current triage process.
- Monitor Low and Medium severity patient flow to identify opportunities for operational improvements.

BUSINESS IMPACT

This analysis identified operational patterns associated with prolonged ER wait times, enabling hospital leadership to prioritize further investigation into peak-day/hour capacity and patient flow.
